

Uninstall an RPM package of Logstash

To uninstall an RPM package of Logstash from a server, you can use the following steps:

Step 1: Find the name of the Logstash RPM package

You can use the following command to list all the RPM packages installed on your server and find the name of the Logstash package:

```
rpm -qa | grep logstash
```

This will give you the name of the Logstash RPM package installed on your server.

Step 2: Uninstall the Logstash RPM package

Once you have the name of the Logstash RPM package, you can use the following command to uninstall it:

```
sudo rpm -e <package-name>
```

Replace <package-name> with the actual name of the Logstash RPM package that you obtained in step 1. This command will remove the Logstash RPM package from your server.

Step 3: Remove Logstash configuration files (Optional)

If you want to remove the Logstash configuration files along with the RPM package, you can use the following command:

```
sudo rm -rf /etc/logstash
```

Please note that removing the configuration files will also delete any custom configurations you may have made, so use this command with caution.

That's it! The Logstash RPM package should now be uninstalled from your server. Make sure to restart any relevant services or daemons to apply the changes, if necessary.
